

Airtable Schema

AI Competitor Intelligence Pipeline

1. Purpose

This document defines the Airtable data model used by the AI Competitor Intelligence Pipeline. Airtable is the final storage layer for competitor pricing records created by the Gumloop workflow.

Each row in the table represents one competitor pricing plan extracted from a competitor pricing page.

2. Base and Table

Item	Value	Purpose
Base	Competitor Pricing Intelligence Tracker	Stores the project tracker for competitor research.
Table	Pricing Records	Stores one record per competitor pricing plan.
Record Unit	One pricing plan	Example: Notion Business, Notion Plus, Notion Enterprise.

3. Field Schema

Field Name	Field Type	Required	Description
Competitor Name	Single line text	Yes	Company or product name, such as Notion.
Plan Name	Single line text	Yes	Name of the pricing plan, such as Free, Plus, Business, or Enterprise.
Price	Single line text	Yes	Listed price or custom pricing. Stored as text to support formats like \$10, \$20, or Custom pricing.
Billing Period	Single line text	Recommended	Billing unit such as monthly, yearly, per member, per seat, or per user.
Target User	Single line text	Recommended	Intended customer segment for the plan.
Key Features	Long text	Recommended	Important features included in the plan.
PM Insight	Long text	Recommended	Product Management interpretation of how the plan is positioned.
Source URL	URL	Recommended	Competitor pricing page used as the source.
Date Checked	Date	Recommended	Date the workflow was run.

4. Example Records

Competitor Name	Plan Name	Price	Billing Period	Target User
Notion	Free	\$0	per member / month	Individuals

Competitor Name	Plan Name	Price	Billing Period	Target User
Notion	Plus	\$10	per member / month	Small teams and professionals
Notion	Business	\$20	per member / month	Growing businesses
Notion	Enterprise	Custom pricing	per member / month	Organizations needing scalability, control, and security

5. Airtable API Payload Format

The Call API node sends one POST request per pricing plan. The request body must use Airtable's required fields wrapper.

```
{
  "fields": {
    "Competitor Name": "Notion",
    "Plan Name": "Business",
    "Price": "$20",
    "Billing Period": "per member / month",
    "Target User": "growing businesses",
    "Key Features": "SAML SSO, private teamspaces, advanced permissions",
    "PM Insight": "Business plan targets growing teams that need stronger admin and security controls.",
    "Source URL": "https://www.notion.com/pricing",
    "Date Checked": "2026-07-02"
  }
}
```

6. Naming Rules

- Airtable field names must match exactly, including capitalization and spaces.
- Use "Competitor Name", not "competitor_name".
- Use "PM Insight", not "pm_insight".
- Do not include extra fields that are not present in Airtable, such as "project" unless that column is created first.
- Use the table name Pricing Records or the table ID in the Airtable API URL.

7. Validation Rules

Check	Expected Result
API response	A successful request returns an Airtable record ID starting with rec...
Record count	Running the Notion test creates four rows: Free, Plus, Business, Enterprise.
Field mapping	Each JSON field appears under the correct Airtable column.
Duplicates	Repeated test runs may create duplicate rows; remove manually or add deduplication later.
Security	No Airtable tokens or private URLs should appear in public screenshots or GitHub.

8. Optional Future Fields

Possible future fields include Competitor Category, Confidence Score, Raw Scraped Text, Previous Price, Change Detected, and Alert Status.
